

SSL

A: Getting your certificate

Step 1: Generate a Private Key

The **openssl** toolkit is used to generate an **RSA Private Key** and **CSR (Certificate Signing Request)**. It can also be used to generate self-signed certificates which can be used for testing purposes or internal usage.

The first step is to create your RSA Private Key. This key is a 2048 bit RSA key which is encrypted using Triple-DES and stored in a PEM format so that it is readable as ASCII text.

```
openssl genrsa -des3 -out server.key 1024
```

```
Generating RSA private key, 1024 bit long modulus
.....+++++
.....+++++
e is 65537 (0x10001)
Enter PEM pass phrase:
Verifying password - Enter PEM pass phrase:
```

This is a watermark for the trial version, register to get the full one!

Step 2: Generate a CSR (Certificate Signing Request)

Once the private key is generated a Certificate Signing Request can be generated. The CSR is then used in one of two ways. Ideally, the CSR will be sent to a Certificate

1. No watermark on the output documents. of the requestor and issue a signed certificate.

2. Can operate scanned PDF files via OCR.

During the generation of the CSR, you will be prompted for several pieces of information. These are the X.509 attributes of the certificate. One of the prompts will be for "Common Name (e.g., YOUR name)". It is important that this field be filled in with the fully qualified domain name of the server to be protected by SSL. If the website to be protected will be https://public.akadia.com, then enter public.akadia.com at this prompt. The command to generate the CSR is as follows:

```
openssl req -new -key server.key -out server.csr
```

```
Country Name (2 letter code) [GB]:CH
State or Province Name (full name) [Berkshire]:Bern
Locality Name (eg, city) [Newbury]:Oberdiessbach
Organization Name (eg, company) [My Company Ltd]:Akadia AG
Organizational Unit Name (eg, section) []:Information Technology
Common Name (eg, your name or your server's hostname) []:public.akadia.com
Email Address []:martin dot zahn at akadia dot ch
Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

Step 3: Remove Passphrase from Key

One unfortunate side-effect of the pass-phrased private key is **that Apache will ask for the pass-phrase each time the web server is started**. Obviously this is not necessarily convenient as someone will not always be around to type in the pass-phrase,

Remove Watermark Now

such as after a reboot or crash. `mod_ssl` includes the ability to use an external program in place of the built-in pass-phrase dialog, however, this is not necessarily the most secure option either. **It is possible to remove the Triple-DES encryption from the key**, thereby no longer needing to type in a pass-phrase. If the private key is no longer encrypted, it is critical that this file only be readable by the root user! If your system is ever compromised and a third party obtains your unencrypted private key, the corresponding certificate will need to be revoked. With that being said, use the following command to remove the pass-phrase from the key:

```
cp server.key server.key.org
openssl rsa -in server.key.org -out server.key
```

The newly created `server.key` file has no more passphrase in it.

```
-rw-r--r-- 1 root root 745 Jun 29 12:19 server.csr
-rw-r--r-- 1 root root 891 Jun 29 13:22 server.key
-rw-r--r-- 1 root root 963 Jun 29 13:22 server.key.org
```

Step 4: Generating a (Self-Signed) Certificate

At this point you will need to generate a self-signed certificate or request certificate signed by a CA by forwarding your CSR.

Example of generating self-signed certificate is shown below:

This is a watermark for the trial version, register to get the full one!

This temporary certificate will generate an error in the client browser to the effect that the signing certificate authority is unknown and not trusted.

Benefits for registered users:

- 1.No watermark on the output documents.
- 2.Can operate scanned PDF files via OCR.
- 3.No page quantity limitations for converted PDF files.

To generate a temporary certificate which is good for 365 days, issue the following command:

```
openssl x509 -req -days 365 -in server.csr -signkey server.key -out server.crt
Signature ok
subject=/C=CH/ST=Bern/L=Oberdiessbach/O=Akadia AG/OU=Information
Technology/CN=public.akadia.com/Email=martin dot zahn at akadia dot ch
Getting Private key
```

Remove Watermark Now

B:Using your certificate

We will use an example of configuring apache server for ssl.

Step 1: Installing the Private Key and Certificate

When Apache with `mod_ssl` is installed, it creates several directories in the Apache config directory. The location of this directory will differ depending on how Apache was compiled.

```
cp server.crt /usr/local/apache/conf/ssl.crt
cp server.key /usr/local/apache/conf/ssl.key
```

Step 2: Configuring SSL Enabled Virtual Hosts

```
SSLEngine on
SSLCertificateFile /usr/local/apache/conf/ssl.crt/server.crt
SSLCertificateKeyFile /usr/local/apache/conf/ssl.key/server.key
SetEnvIf User-Agent ".*MSIE.*" nokeepalive ssl-unclean-shutdown
CustomLog logs/ssl_request_log \
    "%t %h %{SSL_PROTOCOL}x %{SSL_CIPHER}x \"%r\" %b"
```

Step 3: Restart Apache and Test

```
/etc/init.d/httpd stop
/etc/init.d/httpd stop
```

<https://public.akadia.com>

Another example might be to use the certificate programmatically to communicate over ssl.

Step 1: Create a .pfx file from the signed certificate and key

```
openssl pkcs12 -inkey bob_key.pem -in bob_cert.cert -export -out
bob_pfx.pfx
```

This is a watermark for the trial version, register to get the full one!

Add the certificate(.cert) to your keystore.

Step 2: create a TrustManager and HostNameVerifier in your code:

- 1.No watermark on the output documents.
- 2.Can operate scanned PDF files via OCR
- 3.No page quantity limitations for converted PDF files.

* Trust All Certificates - Needed for SSL Client

*/

[Remove Watermark Now](#)

```
private static void TrustAllCerts() throws
java.security.NoSuchAlgorithmException,
java.security.KeyManagementException {

    // Create a trust manager that does not validate certificate chains

    TrustManager[] trustAllCerts = new TrustManager[] {

        new X509TrustManager() {

            public X509Certificate[] getAcceptedIssuers() {

                return null;

            }

        }

    }
```

```

        public void checkClientTrusted(X509Certificate[] certs,
String authType) {

        // Trust always

    }

```

```

        public void checkServerTrusted(X509Certificate[] certs,
String authType) {

        // Trust always

        System.out.println("authType is " + authType);

        System.out.println("cert issuers");

        for (int i = 0; i < certs.length; i++) {

            System.out.println("\t" +
certs[i].getIssuerX500Principal().getName());

            System.out.println("\t" +
certs[i].getSubjectDN().getName());
        }
    }

```

This is a watermark for the trial version, register to get the full one!

Benefits for registered users:

- 1.No watermark on the output documents.
- 2.Can operate scanned PDF files via OCR.
- 3.No page quantity limitations for converted PDF files.

Remove Watermark Now

```

// Install the all-trusting trust manager
